

End Panel Scribe Kit

How the system works

The clamps have been designed to lift end panels 25 mm above the unit and the round scribe tool as a 25 mm radius . As long as your units are level and in the correct position the scribing process is simple.

Attach clamps as shown and make sure that you have no daylight between the Clamp top and the end panel top

Gravity will hold the panel steady enough for you to scribe the bottom with ease

This picture show the trim line. Anything below this line is waist. Tip **never** cut out Your line as this is a reference. Plain or cut to the centre of the line. Seal exposed edges and fix Panel in position.

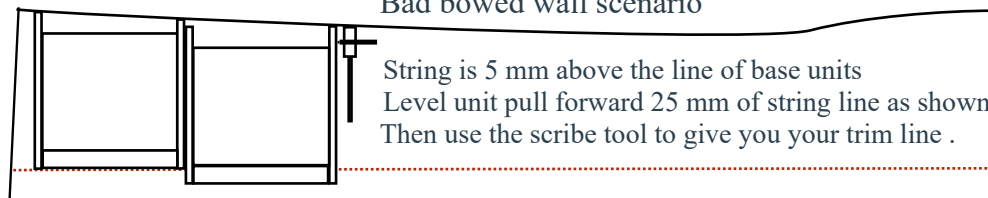

Multiple Panel scribing

The best method of scribing multiple panels is achieved when you join them all together and then Scribe them all to the floor in one go.

This system as been tried and tested over several years and as been found to be a big labour saving device that is very simple to use and the circle scribe tool has many other uses.

Bad bowed wall scenario

String is 5 mm above the line of base units
Level unit pull forward 25 mm of string line as shown
Then use the scribe tool to give you your trim line .

String line gives finished front edge of base unit position
